隔膜调节阀 Diaphragm Control Valve

应用 Applications

广泛适用于卫生级的酿酒、乳制品、饮料等食品工业，以及无菌工况的制药领域，实现对管道液体的控制和开/关任务。

Widely used in health level of wine, dairy products, beverages, food industry and pharmaceutical field of aseptic condition, realize to liquid pipeline control and ON/OFF task.

工作原理 Working Principle

常规状态下为封闭状态，此时膜片紧贴阀体内腔，关闭着管道的路径。通过手轮或驱动执行装置来带动阀杆向上运动，球形膜片向上弯曲，从而使阀门形成导通状态，则可实现清洗和开启的目的。膜片把下部阀体内腔和上部阀盖内腔隔开，使位于膜片上部的阀杆、阀芯等零件不受介质的腐蚀，省去了填料密封结构，而且不会产生介质泄漏。优化的阀体设计，使清洗液完全排泄，不会形成滞留现象。

The diaphragm is closed under normal state, and that moment the diaphragm clung to the valve body cavity, and closing off the flow path through the pipeline. When the diaphragm valve have the requirement to clean or open, the valve stem moves upwards according to the manual or pneumatic actuator equipment, spherical diaphragms naturally bend upwards, so that the valve is open and reach the requirement of clean and open.

The diaphragm make the lower body cavity and the upper chamber separated from the valve cover, so that the, tem at the top of the diaphragm, disc media and other parts from corrosion, eliminating the need for packing structure, and no media leaks. The optimize valve body made the cleaning liquid flow out Totally, so that don't have any entrapment.

卫生级罐底气动调节阀

Sanitary Tank Bottom Pneumatic Control Valve

概述 Overview

卫生级气动罐底阀是气动操作的单座阀门，安装于罐底，用于乳品，食品加工，饮料生产，制药业和精细化工等行业。具有排放物料无死角、无残留、无泄漏以及密封性能好等优点。阀内采用镜面抛光，粗糙度为0.2–0.45um，阀门使用更加洁净，利用压缩空气推动气动执行器内的活塞上移，活塞杆和阀杆螺纹连接，同时在空气压缩推动气动执行器内的活塞上移时也推动了阀杆阀座的上移，阀座向容器内延伸，开启阀门。空气压缩低于弹簧作用力或无气体压缩时，活塞在弹簧的作用下，活塞向下推动同时带动阀杆下移，关闭阀门。

Sanitary Pneumatic Tank Bottom Valve is a pneumatically operated single-seat valve installed at the bottom of tanks for dairy, food processing, beverage production, pharmaceutical and fine chemical industries. It has the advantages of no dead angle, no residue, no leakage and good sealing performance. The inside of the valve is mirror polished, with a roughness of 0.2–0.45um. The valve is cleaner to use. Compressed air is used to push the piston in the pneumatic actuator up, and the piston rod and the valve stem are threaded. When the piston moves up, it also promotes the upward movement of the valve stem valve seat, and the valve seat extends into the container to open the valve. When the air compression is lower than the force of the spring or there is no air compression, the piston is pushed down by the spring under the action of the spring, and the piston drives the valve stem down to close the valve.

特点 Features

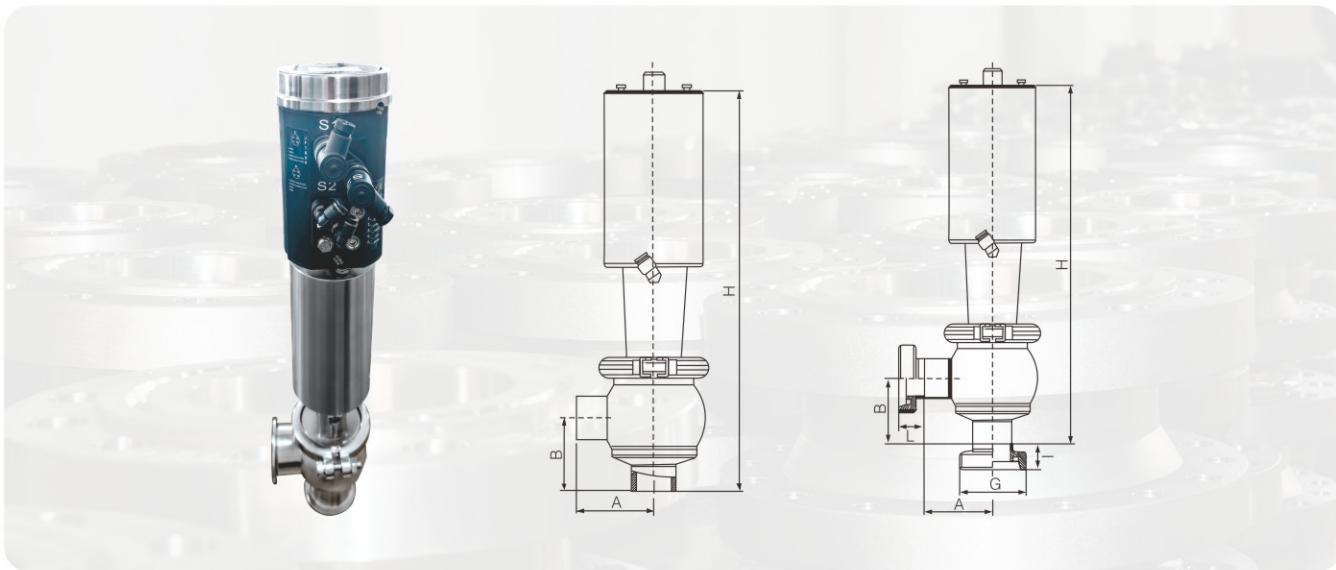

- ◆ 完全的排水系统防止了产品的滞留。
- ◆ 常闭型阀门(通过弹簧关闭)–标准型。
- ◆ 简单的转换一下气动，就成为常开型阀门(通过弹簧开启)。
- ◆ 阀座开启到罐内部是为了防止意外开启。
- ◆ 即使在罐上焊上法兰，也可以进行360° 调节。
- ◆ 开启的窗口用于观看检查轴的密封情况。
- ◆ Complete drainage system prevents product retention.
- ◆ Normally closed valve (closed by spring) – standard type.
- ◆ Simply convert the pneumatic to become a normally open valve (opened by a spring).
- ◆ The valve seat opens to the inside of the tank to prevent accidental opening.
- ◆ Even if the flange is welded on the tank, it can be adjusted 360°.
- ◆ The opened window is used to watch and check the sealing condition of the shaft.
